

CRICFIT AI — BOWLING ANALYSIS PERFORMANCE REPORT

Activity: **Bowling Analysis** | Report ID: CF-574DA8FC | Date: 07 Sep 2026, 10:07 PM

64/100
Overall Score (High Risk)

1. ATHLETE PERFORMANCE & TECHNICAL SUMMARY

You delivered a solid fast delivery with good arm action and speed, which is great for getting wickets. Your runup and shoulder rotation were smooth, but the data shows a bit of asymmetry in your body alignment, especially around the hips and shoulders. This can lead to uneven power transfer and a higher risk of injury over time. Fixing that will make your deliveries more consistent and faster.

Action Profile: Right Fast | Closest Pro Bowler Match: Tim Saudi

2. BIOMECHANICAL METRICS (0 – 100)

Biomechanical Metric	Score	Standard Benchmark	Status
Balance	57/100	75.0 / 100	Needs Work
Lower Body Stability	57/100	75.0 / 100	Needs Work
Hip Mobility	62/100	75.0 / 100	Needs Work
Core Stability	59/100	75.0 / 100	Needs Work
Coordination	95/100	75.0 / 100	Elite
Body Symmetry	59/100	75.0 / 100	Needs Work
Movement Quality	60/100	75.0 / 100	Needs Work

3. TARGETED CRICKET FITNESS DRILLS & IMPROVEMENT MECHANICS

1. Single-Arm Cable Row (3 sets × 12 reps each side) — Target: Upper back and scapular stabilizers

How this fixes your technique: Strengthens the muscles that keep the shoulder blade stable during the delivery, improving shoulder alignment and reducing asymmetry.

2. Medicine Ball Rotational Throw (3 sets × 8 reps each side) — Target: Core rotators and shoulder girdle

How this fixes your technique: Enhances the rotational power from the hips to the shoulders, tightening the hip-to-shoulder coordination for faster, more consistent releases.

3. Side Plank with Hip Drop (3 sets × 15 sec hold each side) — Target: Obliques and transverse abdominis

How this fixes your technique: Builds balanced core strength, reducing lower-back asymmetry and improving overall stability during the bowling action.

Long-Term Performance Impact: By consistently working on shoulder stability, core symmetry, and hip-to-shoulder coordination, you'll see a noticeable increase in delivery speed and consistency. A stronger, more balanced core will also lower the risk of lower-back injuries, allowing you to bowl longer spells without fatigue. Over time, these improvements

translate into more wickets and a higher overall performance level on the field.

4. CRICKET NUTRITION & RECOVERY GUIDELINES

Pre-Training Energy:	A small bowl of oatmeal with a banana and a splash of milk 1■2 hours before training – gives steady carbs and a bit of protein for energy.
Post-Training Recovery:	A protein shake with whey protein, a handful of berries, and a glass of coconut water within 30 minutes – helps muscle repair and replenishes electrolytes.
Hydration Strategy:	Aim for 500ml of water 30 minutes before the session, then sip 200ml every 15 minutes during play. Include a sports drink with sodium and potassium for sessions longer than 90 minutes.
Key Power Foods:	• Chicken breast – high■quality protein for muscle repair • Sweet potato – complex carbs for sustained energy • Spinach – iron and magnesium for muscle function
