

CRICFIT AI — YO-YO ENDURANCE TEST PERFORMANCE REPORT

Activity: Yo-Yo Endurance Test | Report ID: CF-AD13B7D0 | Date: 07 Sep 2026, 09:21 PM

54/100
Overall Score (High Risk)

1. ATHLETE PERFORMANCE & TECHNICAL SUMMARY

The player finished the Yo-Yo at the target score of 16.5, showing good speed and a strong back-leg drive. However, only three shuttles were captured in the video, meaning the test was cut short and the player was cutting into the mandatory recovery period. The main flaw is that the player was not fully extending the leg at the end of each shuttle and was returning to the line too early, which can leave them feeling rushed during match play. These inconsistencies can hurt stamina and make the player more prone to fatigue and injury.

Shuttles Detected: 3 | Cadence Trend: Increasing

2. BIOMECHANICAL METRICS (0 – 100)

Biomechanical Metric	Score	Standard Benchmark	Status
Balance	50/100	75.0 / 100	Poor
Lower Body Stability	50/100	75.0 / 100	Poor
Hip Mobility	50/100	75.0 / 100	Poor
Core Stability	50/100	75.0 / 100	Poor
Coordination	50/100	75.0 / 100	Poor
Body Symmetry	85/100	75.0 / 100	Elite
Movement Quality	46/100	75.0 / 100	Poor

3. TARGETED CRICKET FITNESS DRILLS & IMPROVEMENT MECHANICS

1. Single-leg box jump (3 sets × 8 reps each leg) — Target: Glutes, hamstrings, ankle stability

How this fixes your technique: Builds explosive power and forces full leg extension, improving recovery timing and reducing the risk of cutting into the recovery period.

2. Standing hip hinge with resistance band (4 sets × 10 reps) — Target: Posterior chain, core stability

How this fixes your technique: Strengthens hip extension and core engagement, ensuring the hips stay aligned and the player can maintain a smooth transition between steps.

3. Dynamic balance drill: lateral shuffle with cone (3 sets × 15 steps each side) — Target: Hip abductors, proprioception

How this fixes your technique: Improves directional change and hip stability, reducing the direction anomaly and helping the player stay on the correct line during recovery.

Long-Term Performance Impact: Sticking to this routine will give the player a stronger, more consistent recovery, allowing them to maintain high intensity throughout a match. The drills build power, stability, and proprioception, which translate to faster sprinting, better fielding, and reduced fatigue. By addressing the leg extension and timing issues, the player will also lower the risk of hamstring and ankle injuries, keeping them available for more games.

4. CRICKET NUTRITION & RECOVERY GUIDELINES

Pre-Training Energy:	1 cup oatmeal with a sliced banana and a drizzle of honey, plus a small handful of almonds
Post-Training Recovery:	Whey protein shake with 1 scoop whey, 1 cup skim milk, 1 banana, and a tablespoon of honey
Hydration Strategy:	Start with 500ml water 30 minutes before training, then 250ml every 15 minutes during play; add a sports drink with electrolytes after 30 minutes of continuous activity
Key Power Foods:	• Sweet potato – fast■replenishing glycogen for endurance • Chicken breast – lean protein for muscle repair • Mixed berries – antioxidants to reduce inflammation
